

- Symmetric Cryptosystem vs Asymmetric Cryptosystem
  - Problems
    - 1 transmission
    - 2 security
    - 3 n choose 2 pair of keys
  - How Asymmetric Cryptosystem solves these problems:
    - 1 transmission
    - 2 security: hard number theory
    - 3 everyone has just one set of public/private keys
- Number Theory:
  - definition( $d|a$ , composite vs prime, common divisor, gcd)
    - propositions(1:  $a|b$ ,  $b|c$ , so  $a|c$ , 2:  $a|b$ ,  $b \neq 0$ ,  $a \leq b$ , 3:  $d|a$ ,  $d|b$ ,  $d|(ra+sb)$ , 4: 1 divides  $a, b$ , 5:  $a \neq 0$  &  $b \neq 0$ , there are finitely many common divisors)
  - Division lemma
    - Prove Existence( $r=a-qn$ , pick the best  $q$ ,  $r$  must be  $0 \leq r < n$ )
    - Prove uniqueness(subtract,  $n < r' - r$ , contradiction)
  - Thm:  $\gcd(a, b) = \min\{xa+yb: x, y \text{ in } \mathbb{Z}, xa+yb > 0\}$ 
    - Proof
      - $d$  is a common divisor of  $a, b$ 
        - Suppose  $d$  is the smallest  $x'a+y'b$ , and  $0 < r < d$ , contradiction! So  $r = 0$ ,  $d|a$
      - $d$  is the greatest
        - Suppose  $z|a$ ,  $z|b$ ,  $z|x'a+y'b \rightarrow z \leq b$
    - Corr
      - $xa+yb=1 \Leftrightarrow \gcd(a, b)=1 \Leftrightarrow a, b$  rela prime
  - Prop:  $\gcd(a, b) = \gcd(b, r)$ 
    - Proof
      - $x|a$  &  $x|b$  iff  $x|b$  &  $x|r$
  - Euclid's Algorithm
    - Algo: while( $a_i \neq 0$ ) {compute  $a_{i-1} = q*a_i + a_{i+1}$ ;  $i++$ } output  $a_{i-1}$ 
      - $a_i$  strictly decreases, so terminates eventually
    - $r < \frac{1}{2} a$  (if  $a \leq n$ )
      - Proof( $b \leq 1/2a$ ,  $b > 1/2a$ :  $a = 1*b + (a-b)$ ,  $a-b < b$ )
    - Number of steps in Euclid Alg is  $\leq 2\log_2 a$ 
      - $a_6 < \frac{1}{2} a_4 < \frac{1}{4} a_2 < \frac{1}{8} a_0$
      - $a_{2j} < (\frac{1}{2})^j a$
      - #steps  $\leq 2\log_2 a (a_{2\log_2 a} < (\frac{1}{2})^{\log_2 a} = 1) \leq \text{integrity}$

- Extended Euclid Algorithm
  - $x_{j+1} = q_j x_j + x_{j-1}$  &  $y_{j+1} = q_j y_j + y_{j-1}$
  - $a_j = (-1)^j x_j * a + (-1)^{j+1} y_j * b$
  - Prove  $a_j = (-1)^j x_j * a + (-1)^{j+1} y_j * b$ 
    - Induction, express  $a_{j+1}$  as  $-q_j * a_j + a_{j-1}$
- FTA
  - Prove Existence
    - induction(prime case, not prime case)
  - Thm: if  $p$  prime,  $p|ab \rightarrow p|a$  or  $p|b$ 
    - Prove: (suppose  $p \nmid b$ , then  $1 = xp + yb$ , multiply by  $a$ ,  $p|a$ )
  - If  $p|q_1 q_2 q_3 \dots q_m$ , then  $p = q_i$ 
    - Prove by induction and previous Thm
  - Prove Uniqueness
    - Prove by contradiction and previous Thm
  - $p|ab \rightarrow p|a$  and  $p|b$ 
    - Proof
  - $\gcd(a, b) = \text{Multiplication}(p_i^{\min\{e_i, d_i\}})$
- Fermat's Little Theorem
  - $p$  prime,  $a \in \mathbb{Z}_p^*$ ,  $a^{(p-1)} = 1 \pmod p$
- Euler's Theorem
  - $n > 1$ ,  $a \in \mathbb{Z}_n^*$ ,  $a^{\phi(n)} = 1 \pmod n$
  - Cor:  $a^{-1} = a^{\phi(n)-1} \pmod n$
  - proof:  $\text{order}(a) | \phi(n)$
- Carmichael Numbers
  - when do we use them?
- Abstract Algebra:
  - $a$  congruent to  $b \pmod n$ 
    - Definition ( $n|a-b$ )
      - mod:  $a = q*n + r$ ; cong:  $n|a-b$
    - Characteristics
      - $a \text{ cong } a \pmod n$
      - $a \text{ cong } b \pmod n \Rightarrow b \text{ cong } a \pmod n$
      - $a \text{ cong } b \pmod n \Rightarrow b \text{ cong } c \pmod n \Rightarrow a \text{ cong } c \pmod n$
    - $a \text{ cong } b \pmod n$  &  $c \text{ cong } d \pmod n$ 
      - $\Rightarrow a + c \text{ cong } b + d \pmod n$  &  $a*c \text{ cong } b*d \pmod n$
  - $\mathbb{Z}_n$  groups
    - $a + n\mathbb{Z}$  (congruence classes),  $\mathbb{Z}/n\mathbb{Z}$
    - $(a + n\mathbb{Z}) + (b + n\mathbb{Z}) = (a + b) + n\mathbb{Z}$ ,  $(a + n\mathbb{Z}) * (b + n\mathbb{Z}) = (a*b) + n\mathbb{Z}$ 
      - because  $a + n\mathbb{Z} = a' + n\mathbb{Z} \Leftrightarrow a \text{ cong } a' \pmod n$

- Isomorphism between  $a$  and  $a+n\mathbb{Z}$
- Abelian Groups
  - Closed, associ( $a+(b+c)=(a+b)+c$ ), identity( $a*\epsilon = \epsilon*a = a$ ), inverse( $a*b = b*a = \epsilon$ ), group, abelian( $AB=BA$ , must satisfy group property)
    - Rubik's cube example
  - Suppose  $G = (V,0)$  is a group
    - Unique identity
    - Unique inverse
  - Definition of unit
    - $a$  is a unit in  $n$  iff  $\gcd(a,n) = 1$
  - Definition of  $\mathbb{Z}_n^*$ 
    - $\mathbb{Z}_n^*,*$  is a group
  - Definition of  $\phi(n)$
- Chinese Remainder Thm( $n_1 \dots n_k$  rela prime,  $x$  solves  $x \text{ cong } b_i \text{ mod } n_i$ )
  - $x \text{ cong } \text{Summation}(b_i * N_i * N_i^{-1} \text{ inverse})$
  - Proof: if  $x = x' \text{ mod } n_1, n_2, n_3 \dots n_k$ , then  $x = x' \text{ mod } n_1 * n_2 \dots n_k$ 
    - $n_1 | x - x', n_2 | x - x' \dots$  since  $n_1, n_2 \dots$  rela prime,  $n | x - x'$
- Definition of subgroup
  - $\alpha^0 = \epsilon$
  - $\langle \alpha \rangle$ : subgroup of  $G$  generated by  $\alpha(\alpha * \alpha \dots)$
  - $\text{order}(\alpha) = \min \{i \text{ in } \mathbb{Z}: \alpha^i = \epsilon\}$
  - Prop:  $\text{order}(\alpha) < \infty$ ,  $\langle \alpha \rangle$  isomorphic to  $(\mathbb{Z}_{\text{order}(\alpha)}, +)$ ,  $\alpha^{(\text{order}(\alpha)-1)} = \alpha^{-1}$
  - Prove prop(2.  $\alpha^{(s+t)} = \alpha^{(qs+r)}$ )
- Lagrange Thm:  $|H| \mid |G|$  (proven by propositions below)
- Left coset
  - Each left coset has cardinality  $|H|$
  - Left coset partition  $G$
  - Proof
    - $g^{-1}gh_1 = g^{-1}gh_2 \rightarrow h_1 = h_2$
    - $g_1h_1 = g_2h_2 \rightarrow g_1H \text{ belongs to } g_2H$
- $\text{Summation}(\phi(d) = n) (d|n)$ 
  - Proof 1(paired off), 2( $1 \leq x \leq n/b$  bijection  $1 \leq x \leq n$ ), 3( $U = \gcd(a,n) = d$ )
  - Cor:  $\phi(pq) = (p-1)(q-1)$
- Computational Complexity
  - $2^x$  is  $O(e^x)$  but  $e^x$  is not in  $O(2^x)$
  - $\text{length}(n) = \Theta(\log n)$ 
    - $d^k \leq n \leq d^{(k+1)}$

- $k \leq \log d \leq k+1$
- Running time =  $\Theta(\text{size of input}) \rightarrow$  efficient!
- Example 1: Euclid's Alg  $\rightarrow$  efficient
  - $\Theta(x)$
- Example 2: Brute force primality testing  $\rightarrow$  exponential
  - $\Theta(2^x)$
  - $\Theta(\sqrt{2}^x)$  ---modified
- Fast Exponentiation
  - 1. write  $b$  as  $b_i \cdot 2^i$  (remainder is for  $i=0 \dots k$ , divide until quotient is 0)
  - 2.  $5^{(2^a)} \cdot 5^{(2^b)} \cdot 5^{(2^c)} \dots$
  - $k$  operations  $\rightarrow$  efficient
- Ciphers
  - RSA
    - To do list (find large primes, find units in  $\phi(n)$ , security)
    - public:  $(n, e)$  private:  $(p, q, d)$   $(m^e)^d \bmod n = m \bmod n$
    - What is the prob that  $n$  is not invertible
      - $(n\text{-invertible})/n = (pq - (p-1)(q-1))/pq = (p+q-1)/pq$
    - Digital signatures
      - Authentication, nonrepudiation, efficiency
      - Why cannot forge signature
        - $s = m^d \bmod n$   $m = s^e \bmod n$ , as hard as RSA!
  - Rabin
    - $m^2 \bmod p$ , no other square roots besides  $m$  and  $-m$ 
      - Prove by contradiction, suppose  $a^2 \equiv m^2 \pmod p$ ,  $p \nmid a^2 - m^2$ ,  $p \mid (a-m)(a+m) \rightarrow a \equiv m \pmod p$  or  $a \equiv -m \pmod p$
    - $p \equiv 3 \pmod 4$ , square roots are  $c^{(p+1)/4}$ 
      - Proof:  $(c^{(p+1)/4})^2 \equiv c \pmod p$
    - $p, q$  distinct primes, how to find four sq roots of  $pq$ 
      - $m_1 = c^{(p+1)/4} \bmod p$ ,  $m_1 = c^{(q+1)/4} \bmod q$
      - $m_2 = c^{(p+1)/4} \bmod p$ ,  $m_2 = -c^{(q+1)/4} \bmod q$
      - $m_3 = -c^{(p+1)/4} \bmod p$ ,  $m_3 = c^{(q+1)/4} \bmod q$
      - $m_4 = -c^{(p+1)/4} \bmod p$ ,  $m_4 = -c^{(q+1)/4} \bmod q$
      - Proof:  $m^2 \equiv c \pmod{pq} \Rightarrow pq \mid m^2 - c \Rightarrow p \mid m^2 - c \ \& \ q \mid m^2 - c \Rightarrow$   
 $m^2 \equiv c \pmod p$ ,  $m^2 \equiv c \pmod q \Rightarrow$   
 $m \equiv \pm c^{(p+1)/4} \pmod p$ ,  $m \equiv \pm c^{(q+1)/4} \pmod q$
    - Efficient algo for computing 4 distinct sq roots provides an efficient factorization of  $pq$

- $m_1^2 \equiv c \pmod{pq}$ ,  $m_2^2 \equiv c \pmod{pq} \Rightarrow m_1^2 \equiv m_2^2 \pmod{pq} \Rightarrow pq \mid (m_1 + m_2)(m_1 - m_2)$  [ $p, q$  must one in  $(m_1 + m_2)$ , one in  $(m_1 - m_2)$ ]  
 $\Rightarrow \gcd(pq, (m_1 - m_2)) = p$  or  $q$
    - Proof
  - Elgamal
    - Primitive root definition ( $\langle r \rangle = Z_{p^*}$ ,  $r \in Z_{p^*}$ )
    - All primes  $p$  have a primitive root
    - Discrete logarithm
      - No efficient algorithm for computing  $\text{dlog}_r$
    - Diffie Hellman Key Exchange
      - $A = r^a \pmod{p}$ ,  $B = r^b \pmod{p}$
      - $k = A^b$  or  $B^a$  but Eve cannot know  $k, a, b$
      - Problem: find  $k$  efficiently from  $p, r, A, B$
    - Elgamal Cryptosystem
      - $c = km \pmod{p}$ ,  $m = k^{-1}c \pmod{p}$
      - Bob inverts  $k$ 
        - Use Euclid's Algo
        - $k^{-1} = A^{(p-1-b)} \pmod{p}$
- Factorization
  - Running time
    - $2^r \leq p_1 p_2 \dots p_r = n \Rightarrow r \leq \log_2 n$
    - $r$  is in  $x$ , so running time is  $xP(x)$  if factoring is in polynomial time
  - Factoring
    - Trial division
      - Method: divide  $1 \dots \sqrt{n}$
      - Analysis: not efficient
        - $\sqrt{e}^x$
        - Even only check primes [ $\text{density of primes } 1/\log_e m$ ]  
 $\sqrt{n}/\log \sqrt{n} \quad n^{0.00000001} > \log n$   
 $\sqrt{n}/n^{0.00000001}$  is not helping
    - Fermat Factorization
      - Method: for  $i = 0, 1, 2, \dots$  terminate if  $n + i^2 = x^2$
      - Analysis:  $n, a, b$  odd, set  $i = (b-a)/2$
      - RSA prime choosing lesson: do not take  $a, b$  to be too close
    - Exponent Factorization
      - Thm:  $x^2 \equiv y^2 \pmod{n}$ , if  $x \not\equiv y \pmod{n}$  and  $x \not\equiv -y \pmod{n}$ , then  $\gcd(x-y, n)$  nontrivial factor
      - Method :
        - Express  $k = 2^s \cdot b$  ( $b$  odd integer)

- $\mu_0 = a^b \bmod n$ , for  $i = 1 \dots s$ ,  $\mu_i = \mu_{(i-1)}^2$
  - if  $\mu_{(j-1)} \neq -1$ , last  $\mu$  that is not 1
  - $\gcd(\mu_{(j-1)}-1, n)$  is a non trivial factor also  $\gcd(\mu_{(j-1)}+1, n)$
- Analysis: hope happens
- Use Exponent Factorization to factor  $n$  into  $p, q$  in RSA
  - Method:  $ed-1 = j \cdot \phi(n)$
  - $\frac{1}{2}$  fail,  $\frac{1}{2^l}$  fail
  - $ed$  poly in  $n$
- P-1 Method
  - Method:  $2^{(B!)} = ((2^2)^3)^4 \dots$  if  $\gcd(b-1, n) > 1$ , then  $\gcd(b-1, n)$  is nontrivial factor
  - Analysis: Suppose  $p-1$  has small primes in its prime decomp, so  $p-1 \mid B!$ , suppose  $q-1 \nmid B!$ ,  $2^{(B!)} = 2^{(p-1 \cdot (B!/(p-1)))} = 1 \bmod p$ ,  $p \mid b-1$ , but  $q \nmid b-1$ ,  $n: pq, p, q, 1$  but  $b-1$  doesn't have  $pq$  as factor, then  $\gcd(b-1, n) = p$
  - Lesson: Do not choose  $p$  if  $(p-1)$  is just small primes in its prime factorization, do not choose  $q$  if  $(q-1)$  is just small primes in its prime factorization
- Quadratic Sieve
  - Given odd int to factor, if  $x^2 \bmod n \equiv y^2 \bmod n$ ,  $x \not\equiv \pm y \bmod n$  (then  $n$  divides  $x+y$  or  $n$  divides  $x-y$ ), then nontrivial factor is  $\gcd(x+y, n)$ ,  $\gcd(x-y, n)$  [\*\*\*some  $n$ 's factors in  $x+y$ , some in  $x-y$ ]
  - Pick  $a_i$  near  $\sqrt{n}$ ,  $\sqrt{2n}$ ,  $\sqrt{3n}$  so that  $a_i^2 = \text{const} \cdot n + \text{small\_integer} \Leftrightarrow a_i^2 \equiv \text{small\_integer} \bmod n$   
Hope small\\_integer is a square
  - Analysis: more columns than rows  $\rightarrow$  linear dependence ( $\det = 0$ )
- Sieve of Eratosthenes
- Generating Large Primes
  - Density( $1/\log_e n$ ,  $1/6 \log_e \log_e n$ )
  - Efficient Testing ( $O(\log_e n)$  tests will be efficient)
    - Ex.  $20 \log_e n$  numbers will almost guarantee 20 primes
- Primality Testing (both Fermat and M-R, if not 1  $\Rightarrow$  not prime immediately)
  - Fermat Test: if  $n$  prime then  $a^{n-1} \equiv 1 \bmod n$ 
    - Method: randomly choose  $a$ , test  $a^{n-1} \equiv 1 \bmod n$
    - Analysis: mysterious
    - Odd, composite  $n$  is Carmichael number if  $a^{n-1} \equiv 1 \bmod n$  for all  $a$  in  $\mathbb{Z}_n^*$ 
      - Ex. 561

- There are infinitely many Carmichael numbers
- Miller-Rabin Thm: if  $n$  prime, either  $\mu_0 = 1$  or  $\mu_i = -1$ , **can filter out some Carmichael numbers!**
  - Method: randomly choose  $l$  integers, check criterion, tell prime/not
  - Analysis: if prime, both says prime
    - If not prime, maybe Fermat says prime but M-R doesn't
    - $P(\text{M-R wrongfully suggests "prime"}) \leq 1/4 \Rightarrow P(\text{wrong}) = (1/4)^l$
- Silly Primality Testing: randomly choose  $a$  in  $1, 2, \dots, n-1$ , compute  $\gcd(a, n)$
- Other
  - Lagrange interpolation scheme
    - Given  $x_1, x_2, \dots, x_k$  distinct,  $y_1, y_2, \dots, y_k$ , find  $P(x) = a_{k-1}x^{k-1} + \dots + a_1x + a_0$  s.t  $P(x_j) = y_j$
    - Vandermonde matrix:  $\det(V) = \text{Product}(x_i - x_j)$  for all  $i < j$ , invertible!
      - Existence + Uniqueness
    - Another approach:  $L_i(x) = \text{Product}((x - x_j)/(x_i - x_j))$  ( $j \neq i$ )  $j$  changes so  $P(x_j) = \sum_{i=1}^k y_i L_i(x_j)$ 
      - Existence shown above
      - Uniqueness: suppose  $P(x_i) = P'(x_i)$  for  $i=1 \dots k \rightarrow P - P'$  is poly with  $\leq k-1$  degree but  $k$  roots  $\Rightarrow P - P' \equiv 0$
  - Field
    - Def: a set  $V$  with two binary operations:  $*$  and  $+$
    - $\mathbb{Z}_p, +, *$  is a field iff  $p$  is prime (all units can find inverses)
  - Secret exchange
    - Pick  $P(x)$ ,  $a_0 = s \leftarrow$  secret
    - pick distinct  $x_1, x_2, \dots, x_w$
    - distribute  $(x_1, y_1), (x_2, y_2), \dots, (x_w, y_w)$  to  $w$  people
    - Any  $k$  of them can derive secret together
